Human DNA sequence from clone RP1-257120 on chromosome 22q13.1-13.2
Contains the 3' end of a novel gene, CYP2D7AP and CYP2D8P
(Cytcothrome P450) pseudogenes, part of the TCP20 gene for
transcription factor 20 (ARL, KIAA0292), the NDIPA6 gene for dehydrogenase (ubiquinone) 1 alpha subcomplex 6, a pseudogene
smillar to GTP-binding protein genes, ESTs, STSs, GSSs and a ca

It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 12915: contig of 12915 bp in length 13015: gap of 100 bp 17657: contig of 4642 bp in length 17757: gap of 100 bp 24225: contig of 6468 bp in length 24325: gap of 100 bp 39950: contig of 15625 bp in length 40050: gap of 100 bp 43993: contig of 3943 bp in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10591 bp in length

Submitted (194-ARM-2002) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 15A, WK E-mail enquiries: huntled (194-ARM-2002) this sequence version replaced gi:17976583.

On Apr 7, 2002 this sequence version replaced gi:17976583.

During sequence assembly data is comparated from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may note be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em.; EMBL; Sw.; SWISSPROT; Tr., TREMBL, Wp.; WORMPEP; Information on the WORMPEP that the content of the following stream of the following stream of the feature table with their source databases: Em.; EMBL; Sw.; SWISSPROT; Tr., TREMBL, Wp.; MORMPEP; Information on the WORMPEP

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Ems. EMBL, Sw., SWISSPROT; Tr., TREMBL; WP., WORMPEP; Information on the WORMPEP that the teacher the found of the teacher the found of the teacher the teacher

On Sep 24, 2003 this sequence version replaced gil3466655.
Sequence from the Mouse Genome Sequencing Consortium whole genome
shotgun may have been used to confirm this sequence. Sequence data
from the whole genome shotgun alone has only been used where it has
a phred quality of at least 30.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AC173198 211176 bp DNA linear HTG 09-FEB-2006

It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

* This sequence will be replaced by the finished sequence as soon as it is available and by the accession number will be preserved.

* The accession number will be preserved.

            NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tuc.edu/docs/Genbank draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            * NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)

* The sequence data in this record represents an 'enhanced' version

* of a Phase 2 submission. The indicated order and orientation of

* each sequence has been established using one or more of the

* following: read-pair data from individual subclones, overlaps

* with neighboring clones, alignment with available reference

* sequence (e.g., human), and/or confirmation by PCR testing.

* NOTE: This is a 'working draft' sequence. It currently

* consists of contigs. Gaps between the contigs

* are represented as runs of N. The order of the pieces

* is believed to be correct as given, however the sizes

* of the gaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

On Nov 15, 2002 this sequence version replaced gi:23269814.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas and whole genome contigs are contensed, and separated in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.

consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 266673;

Submitted (01-JUL-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Jun 29, 2005 this sequence version replaced gi:67625877.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome Kowis,C., Kraft,C.L., Lebow,H., Levan,J., Lewis,L., Li,Z., Liu,J., Liu,J., Liu,W., London,P., Longacre,S., Lopez,J.,

```
NOTE: This is a 'working draft' sequence. It currently consists of 49 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gap of 882 bp

The invention relates to methods for identifying several pre-selected polymorphisms present in cytochrome P450 2D6 (CYP2D6) gene. The method is useful for identifying pre-selected polymorphisms present in cytochrome P450 2D6 gene sequence, e.g., duplication, deletion, inversion, inversion, insertion, translocation, polymorphism resulting in aberrant RNA splicing and a single mucleotide polymorphism resulting in aberrant RNA splicing therapeutic drug or its prodrug to treat a subject suffering from a disease or disorder that involves the respiratory distress syndrome), disease or disorder that involves the respiratory distress syndrome), disease, asthma, bronchitis and adult respiratory distress syndrome), diseastive system (cancers, inflammatory bowel disease, crohn's disease and pancreatitis), skeletal system (Theumatoid arthritis, osteoporosis and pancreatitis), skeletal system (Theumatoid arthritis, osteoporosis posiasis, insulin dependent diabetes mellitus, systemic lupus erythematosus and autoimmune haemolytic anaemia), neurological disorders (Alzheimer's disease, Parkinson's disease and ading. The present sequence is a PCR primer used for all neuron of the control of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequences and at least one assay probe configured to detect a footprint region, amplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related Invader oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.
                                                                                                                                                                                                                     Debrisoquine 4-hydroxylase (CYP2D6)-related Invader oligo - SEQ ID 36.

                                                                                                                                                                                                                                                                                          The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisognine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoguine 4-hydroxylase, CYP2D6 invader oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a CYP2D6-specific invader oligonucleotide that was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies and for identifying the presence or absence of CYP2D6 associated polymorphisms, useful for genotyping a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Debrisoquine 4-hydroxylase (CYP2D6)-related Invader oligo - SEQ ID 66.

p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related Invader oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CY2DD6, gene copies present in a sample and configured to identify the presence or absence of at least two CY2DG associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                             Human debrisoquine 4-hydroxylase, CYP2D6 invader oligonucleotide #14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CPD206, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6 invader oligonucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CPD2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                 New kit comprising an oligonucleotide detection assay for detecting number of CYP2D6 gene copies in a sample and for identifying CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a CYP2D6-specific invader oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies and for identifying the presence or absence of CYP2D6 associated polymorphisms, useful for genotyping a subject

                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                           The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 -associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a CYP2D6-specific invader oligonucleotide that was used in an example of the invention.
                                                                                                                                                                                                   number of CYP2D6 gene copies and for identifying the presence or absence of CYP2D6 associated polymorphisms, useful for genotyping a subject having a CYP2D6 gene.

This invention describes a novel method of detecting the presence of single nucleotide polymorphisms (SNPs) in human CYP2-genes using a priming agent and/or a probe, where the priming agent effects high-cresolution amplification of the respective CYP2 allelomorph. The method can be incorporated into a diagnostic kit that detects the presence of polymorphisms in human cytochrome P450 genes comprising a synthetic cligonucleotide that amplifies isoform-specific (IS-PCR) polymer chain reactions using a DNA polymerase chain reaction. The kit components selectively immobilize single-stranded biotinized IS-PCR products on streptavidin-coated micro-itration slides under stable thermal sorbitons. Test-optimized, allelmorph-specific, fluorescein isothiocyanate (FTTC)-marked synthetic oligonucleotides facilitate conditions. Test-optimized, allelmorphe specific, fluorescein sothiocyanate (FTTC)-marked synthetic oligonucleotides facilitate conducts through a sequence of hybridization, subsequent washing and detection by fluorometry or photometry. The novel diagnostic process is rapid and cost-effective. This sequence represents a primer used to
                                                                                                                                                                                                                                                 ö
The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a CYP2D6-specific invader oligonucleotide that was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Process for demonstrating the presence of single nucleotide polymorphism in human genes, comprises using a priming agent.
                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequence and at least one assay probe configured to detect a footprint region, amplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4 hydroxylase (cytochrome p450 2D6; CYP2D6)-related target oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequences and at least one assay probe configured to detect a footprint region, amplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related target oligonucleotide of the
                                                                                                                                                                                                                                                                        Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies in a sample and for identifying CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detection assay; debrisoquine 4-hydroxylase; CYP2D6;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies and for identifying the presence or absence of CYP2D6 associated polymorphisms, useful for genotyping a subject
       the
                                                                                   The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                              Gaps
New Kit comprising an oligonuclectide detection assay for detecting number of CYP2D6 gene copies in a sample and for identifying CYP2D6
                                                                                                                                                                                                                                                                                                            .

The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 -associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 -associated polymorphisms. The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequence for each of the Y target sequence for each of the Y target sequence for each of the Y footprint region, amplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debiisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related target oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oligonucleotide detection assay; debrisoquine 4-hydroxylase; CYP2D6; cytochrome p450; human; ss.
                                                                              Debrisoquine 4-hydroxylase (CYP2D6)-related target DNA - SEQ ID 39.
                                                                                                               SNP; single nucleotide polymorphism; cytochrome p450; CYP allele; debrisoquine 4-hydroxylase; 2D6; CYP2D6; human; 8s; target.

                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequences and at least one assay probe configured to detect a footprint region, amplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related target oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention comprises an oligonucleotide detection assay configured for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies and for identifying the presence or absence of CYP2D6 associated polymorphisms, useful for genotyping a subject
                                                                                                                                                                                                                                           present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                        The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoguine hydroxylase, CYP2D6, gene copies present in a sample and configured identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimissing nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The
number of CYP2D6 gene copies in a sample and for identifying CYP2D6 associated polymorphisms.
                                                                                                                                                                                                                                                                                                                                       Length 43;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Koelbl JA;

                                                                                                                                                                                                                                       New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies in a sample and for identifying CYP2D6 associated polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New kit comprising an oligonucleotide detection assay for detecting the
                                                                                                                                                                                                                                                                                                                                                     The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6

                                                         ð
                                                                                                                                                             ö
detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 -associated polymorphisms. The oligonuclectide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises an oligomucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 sassociated polymorphisms. The oligomucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.

The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related target oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for characterising a cytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```

```
The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequence for each of the Y target sequence for each of the Y target sequence for mapplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related target oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                         Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Debrisoquine 4-hydroxylase (CYP2D6)-related target DNA - SEQ ID 291.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and except primer sequence for each of the Y target sequence for each of the Y target sequence for each of the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase forting the contracterising a cytochrome p450 2D6; CYP2D6) related target oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Characterizing a cytochrome p450 allele by amplifying Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                     Debrisoquine 4-hydroxylase (CYP2D6)-related target DNA - SEQ ID 70.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Debrisoquine 4-hydroxylase (CYP2D6)-related target DNA - SEQ ID 69.

                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                            The invention relates to a novel method for characterising a cytochrome p450 (CYP) allele (or single nucleotide polymorphism [SNP]) which comprises providing a sample with at least Y target sequences, a primer set comprising a forward and a reverse primer sequence for each of the Y target sequence for each of the Y target sequences and at least one assay probe configured to detect a footprint region, amplifying the Y target sequences with the primer set and detecting at least one of the footprint regions with the assay probe. The method of the invention may be useful for characterising a cytochrome p450 allele. The current sequence is that of a debrisoquine 4-hydroxylase (cytochrome p450 2D6; CYP2D6)-related target oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies in a sample and for identifying CYP2D6 associated polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CPP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6 target.
                                                                                                                                                                                                                                                                                                New kit comprising an oligonucleotide detection assay for detecting number of CYP2D6 gene copies in a sample and for identifying CYP2D6 associated polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligonucleotide detection assay; debrisoquine 4-hydroxylase; CYP2D6; cytochrome p450; human; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        detection assay; debrisoguine 4-hydroxylase; CYP2D6;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New kit comprising an oligonucleotide detection assay for detecting number of CYP2D6 gene copies in a sample and for identifying CYP2D6 associated polymorphisms.
                                                                                                                                                          detection assay; debrisoquine 4-hydroxylase; CYP2D6;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies in a sample and for identifying CYP2D6 associated polymorphisms.
            the
                                                                             The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debrisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The kit and methods are useful for characterising cytochrome p450 genes and alleles or for developing and optimising nucleic acid detection assays for use in basic research, clinical research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a kit which comprises an oligonucleotide detection assay configured for detecting the number of debisoquine 4-hydroxylase, CYP2D6, gene copies present in a sample and configured to identify the presence or absence of at least two CYP2D6 associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies and for identifying the presence or absence of CYP2D6 associated polymorphisms, useful for genotyping a subject having a CYP2D6 gene.
research and for the development of clinical detection assays. The present sequence represents a human debrisoquine 4-hydroxylase, CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6—associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies and for identifying the presence or absence of CYP2D6 associated polymorphisms, useful for genotyping a subject having a CYP2D6 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 17; DB 14; Length 44; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 -associated polymorphisms. The oligomucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises an oligonucleotide detection assay configured for

The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 eassociated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.
                                                                                                                                                                                                                                                             New kit comprising an oligonucleotide detection assay for detecting the number of CYPD6 gene copies and for identifying the presence or absence of CYPD206 associated polymorphisms, useful for genotyping a subject having a CYP206 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 17; DB 14; Length 44; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises an oligonucleotide detection assay configured for detecting the number of CYR2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                    New kit comprising an oligonucleotide detection assay for detecting the number of CYP2D6 gene copies and for identifying the presence or absence of CYP2D6 associated polymorphisms, useful for genotyping a subject

analyze of the problem and the stringent binding conditions, and detecting the presence or absence of the target sequence bound with the probe with a scattered light detectable particle, by observing light scattered light detectable particle, by observing light scattered from the particle which indicates the presence of the target sequence. The method is useful for determining the presence or absence of particular single nucleotide polymorphisms or alleles in genomic nucleic acid, especially in a pharmacogenetically relevant gene or genes in a DNA sample, and to detect and measure one or more target sequences in a sample, the method may also be used to detect specific mutations to identify the phenotypic classification of an individual. ABK30162-ABK30230 represent CYP2D6 target sequence-specific primers of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                   The invention comprises an oligonucleotide detection assay configured for detecting the number of CYP2D6 gene copies present in a sample, and configured for identifying the presence or absence of at least two CYP2D6 associated polymorphisms. The oligonucleotide detection assay of the invention is useful for genotyping a subject having a CYP2D6 gene. The present DNA sequence represents a target region of the CYP2D6 gene which was used in an example of the invention.

The invention relates to a method of determining the presence or absence of a CYP2D6 target sequence in a DNA sample containing CYP2D6 nucleic acid. Determining the presence or absence of a CYP2D6 target sequence in a sample of DNA containing CYP2D6 nucleic acid comprises contacting the nucleic acid with a probe under stringent binding conditions, and detecting the presence or absence of the target sequence bound with the probe with a scattered light detectable particle, by observing light scattered from the particle which indicates the presence of the target sequence. The method is useful for determining the presence or absence of particular single nucleotide polymorphisms or alleles in genemic nucleic acid, especially in a pharmacogenetically relevant gene or genes in a DNA sample, and to detect and measure one or more target sequences in a

The invention relates to a method of determining the presence or absence of a CYP2D6 target sequence in a DNA sample containing CYP2D6 nucleic acid. Determining the presence or absence of a CYP2D6 nucleic as sample of DNA containing the Ducleic acid comprises contacting the nucleic acid with a probe under stringent binding conditions, and detecting the presence or absence of the target sequence bound with the probe with a scattered light detectable particle, by observing light cattered from the particle which indicates the presence of the target sequence. The method is useful for determining the presence of absence of particular single nucleotide polymorphisms or alleles in genomic nucleic acid, especially in a pharmacogenetically relevant gene or genes in a sample, and to detect and measure one or more target sequences in a sample, and to detect and measure one or more target sequences in a sample, the phenotypic classification of an individual. ABX30162.

ABX30230 represent CYP2D6 target sequence-specific primers of the
